

# Safety Leadership

## *An online workshop in two parts*

This workshop is aimed at organisational leaders whose responsibilities include health, safety and wellbeing but who do not specialise in those fields.

This workshop looks at where the field of safety is now, and why numerous current approaches are not necessarily making workplaces more safe. We will approach safety with the rigour of science, and offer practical suggestions for how to do this.

Safety can improve when a scientific approach is used, and these can generalise into improvements in quality, production and other key desirable elements of organisational performance. This online workshop will outline what a scientific approach looks like and explain the knowledge and training required to get to the next step. We will look at various performance frameworks to help organisational leaders design a strategic and measurable approach to achieving successful and sustainable workplace safety.

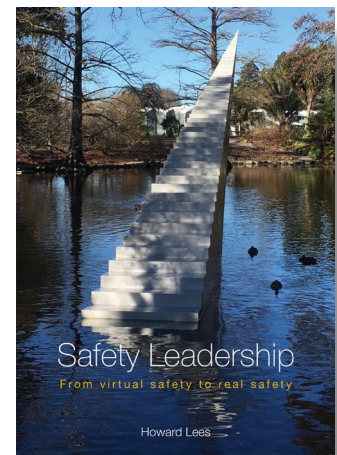

### Workshop topics and outcomes:

- A brief history of safety - how we got here.
- Discuss typical organisational safety problems.
- Discuss why desirable safety processes fail in execution.
- How science can deliver safety leadership solutions.
- Leave with practical next steps.

### Included in the workshop:

- The book 'Safety Leadership' by Howard Lees.
- Attendees will return a simple online questionnaire prior to the workshop.
- An optional 30 minute telephone/video coaching session after the workshop.
- Case studies and frequently-encountered scenarios.

This online workshop will be delivered via two sessions held on Zoom, each 2 hours long. The sessions will take place one week apart, and timing will be set by agreement beforehand. The sessions will be delivered by Hollin Director Rachel Edwards and Senior Consultant Lynn Dunlop.
